Patent no.

Patent application

The invention consists in creating the design of a wooden bench in a rustic style for parks, by using two states of wood: processed with modern methods and the one created by nature.

Description

The load-bearing structure of the bench is made of wood processed by machines and assembled-disassembled by bolts, and the seats are made of practically unprocessed logs, which gives us the feeling of being close to nature.

EN

The seats move in relation to each other in order to bring you closer or further away from the person next to you, which also creates a moment of play.
