### Abstract

The thermoelectric properties of single-crystal layers and polycrystalline glass-insulated microwires made of Ag-doped SnSe in a temperature range of 90-300 K are studied. SnSeAgo.01 single crystals are grown by the vertical Bridgman method from a stoichiometric melt. A 35- $\mu\text{m}$ -thick single-crystal layer is formed by the exfoliation method at a low temperature; glass-insulated polycrystalline microwires with different diameters of 39-141  $\mu\text{m}$  are prepared by the Ulitovsky technique. The power factor of all the samples at room temperature has a value of 15-18  $\mu\text{W cm}^{-1}\text{K}^{-2}$ , which monotonically decreases with decreasing temperature. According to the measured thermoelectric power, all the samples exhibit n-type conductivity.

**Keywords:** Ag-doped SnSe, microwires, power factor, single-crystal layer, thermoelectrics
